

Insight 1: The most-streamed content is not the most-watched

The categories streamers produce most often are not the ones that draw the biggest audiences. Just Chatting is streamed the most (275 streams) but pulls only mid-level peak audiences. Sports is the opposite: relatively few streams (178) but the highest average peak viewers, around 64,500. Creative is streamed often (191) yet draws the smallest crowds, around 13,800 average peak.

Because stream length is nearly identical across categories (about 3.6 to 4.0 hours), the difference is purely audience size per stream, not how often or how long streamers go live.

Why it matters: content volume does not equal audience demand. For acquiring or promoting streamers, audience-per-stream is a far better signal than how active a category looks.

Insight 2: Paying subscribers chat more, but don't watch longer

Engagement splits into two different behaviours. Watch time per session is remarkably stable, around 59 minutes, across every subscription tier and every age group. How long people watch barely varies.

Chat activity is different. It rises steadily with subscription tier: higher-tier subscribers send roughly double the chat messages of free viewers. Subscribers are not watching more; they are participating more.

Subscription tier predicts chat engagement, not viewing time. If the goal is a livelier chat and stronger community, converting viewers to paid tiers is more relevant than trying to extend watch time.

Supporting context

The audience skews young, with viewers aged 18 to 34 making up about 65% of all viewers. Demographics are weak predictors of behaviour: age shows almost no relationship with how much people watch, chat, or cheer. Engagement is driven by subscription tier, not age.

Bottom line

Audience size is decoupled from content volume, and engagement is decoupled from watch time. The biggest opportunities lie in audience-per-stream (not stream count) and in subscriber conversion (not longer sessions).
